EXAMINER'S AMENDMENT

An examiner's amendment to the record appears below. Should the changes and/or additions be unacceptable to applicant, an amendment may be filed as provided by 37 CFR 1.312. To ensure consideration of such an amendment, it MUST be submitted no later than the payment of the issue fee.

Authorization for this examiner's amendment was given in a telephone interview with Mr.

Wesley C. Rosander, applicant's representative on January 25, 2008

The application has been amended as follows:

In the claims:

Claims 1-27 and 45-55 have been cancelled.

Claim 56 has been amended as follows: line 39 "patent" has been changed to "parent".

Reason for allowance

- Claims 56-60 are allowed (renumbered as 1-5). 1.
- 2. The following is an examiner's statement of reasons for allowance:

Referring to claim 56, Bendert teaches a shared file system is shared with plurality of the clients A-B, wherein each client uses (SFS) API to access any file in the (BFS) container and that a complex set of rules are then used to enforce update and avoid conflicts(see [Col. 7, lines 31-44]). Whereas the applicant's teaches each resource manager is independent from one another and independently controls or monitors resources. However, Bendert does not teach or describes a hierarchical data structure used to associate a file object with a resource manager and in specific details the steps used in determining what resource manager is used to control a resource file object opened, or if the file object itself is a root or subdirectory

Application/Control Number:

Art Unit: 2168

resource manager. Bendert discloses a heterogeneous file management system with a common API for accessing two different file systems and with controls to ensure that the rules of each file system are not violated (See[Col. 2,lines 28-31]). Whereas the claimed invention claims for each resource manager is independent from one another, likewise determining a resource manager associated with a file in order to allow the resource manager to monitor transactional relations for that file within a volume, and all the claimed features of applicant's instant invention, specially including "based on the opening of the file object, creating a file control block that provides an in-memory data structure...subdirectory resource manager" as shown in claim 56 now renumbered as claim 1.

Referring to claim 56, Komie discloses the use and building process to containment tree representing the relationships among resource managers, which is used to determine what request/response are directed to or from a particular resource manager (See [Col. 2, lines 19-26]) such as applicant's teachings of the resource managers been independent from one another and independently control or monitor resources. However, Komie does not teach or describes a hierarchical data structure used to associate a file object with a resource manager and in specific details the steps used in determining what resource manager is used to control a resource file object opened, or if the file object itself is a root or subdirectory resource manager.

Therefore, it would not have been obvious to combine the teachings of Komie into Bendert, it is for these reasons that applicant's invention defines over prior art.

After intensive search and a thorough examination of the present application and in light of the prior art made of record, claims 56-60 (renumbered as 1-5) are allowed.
